NEW JERSEY REVISED TOTAL AND AGE & SEX POPULATION PROJECTIONS
JULY 1, 1985 TO 2000

INTRODUCTION

Population projections for the State of New Jersey and its 21 counties are presented in this report. These are the first projections done by the New Jersey Department of Labor's Division of Planning and Research Office of Demographic and Economic Analysis (ODEA) which incorporate county level age and sex counts from the 1980 Census of Population and Housing. They revise and supersede all other projections previously issued by this department.

Four sets of projections are shown in the tables which follow. The projections are labeled: (1) "ODEA ECONOMIC/DEMOGRAPHIC MODEL" which is an economic-demographically linked projection, (2) "ODEA DEMOGRAPHIC COHORT MODEL" which is a purely demographic projection, (3) "LINEAR REGRESSION 1900 TO 1980 MODEL" which is a linear regression projection based on the decennial census population for each county from 1900 through 1980 and (4) "POLYNOMIAL REGRESSION 1900 TO 1980 MODEL" which is a polynomial regression projection based on the same data as the linear regression. Models (2) and (4) are presented in this report for the first time. Models (1) and (3) are updated versions of previously presented models. Models (1) and (2) - ODEA Economic/Demographic and ODEA Demographic Cohort - are termed preferred not because of any predictive qualities, but because they are theoretically superior to the regression models (3 and 4) and yield age and sex detail not available in those two models. The methodologies for these projections are described below.

General Assumptions

Contrary to earlier sets of population projections released by this division, no special adjustments were made for future population growth associated with the Atlantic City hotel-casino industry. The reasons for not making special adjustments were:

(a) Because of the model's economic nature and because of the availability of a somewhat larger historic data base than had been at hand for earlier projections, the ODEA Economic/Demographic Model (1) could account for the anticipated effect of employment growth in the hotel-casino industry and its relation to population growth in ways similar to any other industry in the state. Therefore, no specific adjustments to this model were necessary since anticipated population growth associated with the hotel-casino industry was incorporated directly into the model.

(b) Because no specific demographic (i.e., survival, fertility, migration) adjustments could be made due to the lack of a data base and because economically-based adjustments yielded total populations in the purely demographic models, especially the ODEA Demographic Cohort Model (2), which were very similar to the Atlantic County projections in the Economic/Demographic Model (1), no special adjustments were made to any of the demographic models.

To the extent that the demographic effects of the hotel-casino industry were reflected in the demographic trends of the 1970s, the demographic impact would be included in the three purely demographic projections (Models 2, 3 and 4). This appears unlikely, since the first hotel-casino did not open until about mid-1978 and only three casinos were in operation by the time of the 1980 Census. Therefore, users of the three purely demographic models, including the Demographic Cohort Model (2), may wish to apply a special hotel-casino adjustment which is shown and explained on pages 6 and 7. No special adjustment is needed for the Economic/Demographic Model (1).

As in previously issued sets of projections, no special adjustments were made either for the impact of development restrictions of the Pinelands Comprehensive Management Plan nor for the population forecasts of the Meadowlands Commission.

In the case of the Pinelands, the assumption was made that growth will be redirected within the counties in the Pinelands and that the present projections do not indicate growth beyond limits imposed by the Pinelands plan in any county. The Pinelands plan seeks to allocate growth to designated "regional growth areas." The Pinelands Commission states that these areas will be more than adequate to accommodate regional housing demand projections for the foreseeable future."[1] The housing demand projections cited were based on higher population projections than those reported here.

Since these are baseline projections, no adjustment was made for population forecasts by the Meadowlands Commission for population growth in Bergen and Hudson county communities. Employment and population trends of the 1970s for these areas are included in the Economic/Demographic Model (1) and population trends are in the other three projections. If development occurs which indicates growth beyond the trend levels, then this projected growth will be incorporated in the models in future revisions.

A survey of county planning boards was undertaken to identify major developments which might significiantly alter trends in the counties. No developments aside from the Atlantic City hotel-casinos, the Pinelands and the Hackensack Meadowlands were identified as having the potential to change trends substantially.

Baseline Projections - Not Forecasts and Not Goals

The numbers in this report are projections, not forecasts or predictions. A projection is the measurement of a future condition that would exist if the rules and assumptions of the method proved to be empirically valid in the future. Projections may assume continuations of past conditions, present conditions or trended changes in historical conditions. They may also assume entirely new transition rates. Given the method and the assumptions, a projection is always correct if the operations of the projection method are carried out without error. The number of possible projections for any given population is therefore infinite. A forecast, on the other hand, is a projection that is also a judgemental statement concerning the expected measurement of future conditions; it is a prediction. All forecasts are projections, but not all projections are forecasts.[2] Again, numbers in this report are projections.

Furthermore, the projections in this report are not to be interpreted as goal or policy oriented. They are not intended to constrain or to advocate specific levels of growth in any areas of the state. All series are presented as baseline, that is, independent of exogenous public or private interventionist activities of an unusual, unforeseen or undocumented nature or magnitude. They are based primarily on identifiable, demographic and economic secular trends which have been implicitly or explicitly incorporated into the models. The greatest value of the projections is as a reference framework for planning, policy evaluation and considerations of alternative growth scenarios which could be achieved through greater or less resource development.

ODEA ECONOMIC/DEMOGRAPHIC AND ODEA DEMOGRAPHIC COHORT MODELS: PREFERRED PROJECTIONS

The "ODEA ECONOMIC/DEMOGRAPHIC" and "ODEA DEMOGRAPHIC COHORT" Models are both cohort-component method projections. That is, the base population is survived five years in each iteration of the projection cycle and births are projected by applying fertility rates to survived females aged 15 to 44 years of age to determine the population due to natural increase. Net migration for persons aged 65 years of age and over is computed based on observed trends prevailing in the 1970s.

The difference between the two models is in the way migration of persons under 65 years of age is projected. In the Economic Model (1), such migration is computed based upon projected labor market conditions, whereas in the Cohort Model (2), such migration is projected based on observed trends that prevailed in the 1970s. In the Cohort Model (2), migration of persons under 65 is projected in the exact same way as the migration of persons 65 years of age and over.

Base Populations

An estimated July 1, 1980 population by age, sex and race is the base population for these projections. The July 1, 1980 population was determined by linearly projecting the 1970 to 1980 intercensal change by age, sex and race group one quarter of a year. These numbers were forced to a state control.

Prior to the projection of the July 1, 1980 population, the April 1, 1980 census data was adjusted in order to improve comparability of race data to the 1970 census. In the 1980 census, persons who did not classify themselves in one of the specific race categories but reported entries such as Mexican, Puerto Rican, Cuban, Dominican or some other entry indicating Spanish Origin were included in the "other" races category. In the 1970 census, most of these persons were included in the "white" category. Thus, for April 1980, persons of Spanish origin in the "other" races category were re-classified as white prior to projecting the July 1, 1980 population.

Group Quarters Populations

Persons in group quarters as of April 1, 1980 are removed from each age, sex and race group prior to projecting the population. These populations are held constant and, at the end of each projection iteration, are then added to the projected base populations to yield projected total populations.

Fertility Rates

The number of births in the projection interval is calculated by applying general fertility rates to women of childbearing age (15 to 44 years old). The county and race-specific general fertility rates were calculated and projected in line with the national "Middle Series" projections based on the historical relation of the state and county rates to national rates.[3]

The series assumes the ultimate level of completed cohort fertility will be 1.9 births per woman. Although this assumption appears reasonable, significant deviation from it in either direction is possible in the projection period. Additionally, shifts in the timing of births (for example, an acceleration in the trend toward postponing the birth of the first child until the late twenties) will affect these rates and, correspondingly, the validity of the projections.

Mortality Rates

The civilian populations are survived using age, sex and race-specific survival rates. The survival rates used for the projections are projected in line with the national "Middle Mortality Assumption" projections assuming no immigration.[4] The survival rate projections assume a narrowing of the historical relation of New Jersey State rates to national rates such that the rates are equal by the year 2000. No major medical developments which would have a significant impact on mortality have been assumed in the model. Survival rates are applied to births and to each age cohort. The survived population is subject to natural increase, but it is closed to net migration.

Migration of Persons 65 Years of Age and Over

Migration patterns of persons 65 years of age and over are assumed to follow migration patterns estimated from 1970 to 1980 trends. However, no age, sex and race cohort is allowed to increase or decrease its population via migration by more than 50% over any 10-year period.

Migration of Persons Under 65 Years of Age

In the Economic Model (1), the under 65 year old migration is determined by the projected labor market. In simple terms, an over-supply of labor relative to the demand for workers results in a net out-flow of persons from the county while high demand relative to supply pulls in migrants to balance the labor market. As stated previously, the group quarters populations are assumed to remain at the 1980 levels.

Labor supply is estimated by applying projected labor force participation rates to persons 16 to 64 years of age in the survived population that is closed to migration. These rates are based on national labor force projections by age, sex and race produced by the U. S. Bureau of Labor Statistics. Labor demand is determined by adjusting exogenously projected employment by county to a residence basis. The labor supply and demand are compared to produce a level of unemployment within a range which has been projected as neutral regarding migration. This range was projected based on the historical relation of the county levels to state levels. The state unemployment rate is projected to be 7.4% in 1985 and 6.0% in 1990 and thereafter. The labor market, then, determines the number of net migrants needed to bring the labor market into balance. This figure is inflated to account for non-labor force migrants under 65 years of age such as dependents. Total migration is distributed by age, sex and race in the Economic Model (1) according to the estimated migration distribution for the 1970s.

In the Cohort Model (2), the migration of persons under 65 years of age is assumed to follow migration patterns by age, sex and race estimated from 1970 to 1980 trends. As with persons 65 and over, 50% ceilings and floors are set on the 10-year change in population due to migration.

Total Migration

The resulting migrants are added to or subtracted from the survived population that is under 65 years of age and is closed to migration. The result is the projected household population under 65 years of age. The sum of these cohorts, of the 65 years of age and over cohorts and of the group quarters cohorts is the total projected population for each county.

Hotel-Casino Population Adjustment for Atlantic County Purely Demographic Projections (Models 2, 3 and 4)

As explained previously, no special adjustment was made for changes in population associated with the Atlantic City hotel-casino industry. Although, by its economic nature, the ODEA Economic/Demographic Model (1) is able to account for the impact of the hotel-casino industry without specific adjustments, it appears unlikely that population trends of the 1970s which are included in the other projections adequately reflect the demographic impact of the hotel-casinos.

Therefore, users of the three strictly demographic projections, including the Cohort Projection (Model 2) may wish to apply a rather simplistic special Hotel-Casino Population Adjustment to Atlantic County's population. Direct employment in hotel-casinos is projected to be 32,905 in 1985 and 38,155 in 1990 and thereafter. This employment would be generated by 12 hotel-casinos in operation by 1985 and 14 in operation by 1990.

About 71.3% of hotel-casino employees lived in Atlantic County as of April 1981, based on a survey done by this Division.[5] In 1980, the population under 65 to employment ratio for the county was 1.7927. Multiplying the post-1980 changes in direct employment by 71.3% and then by the population to employment ratio can yield approximate projections of the growth in population due to casino employment by 1985 and 1990. Such growth is 24,929 in 1985 and 31,064 in 1990 and thereafter. Addition of such growth to the Cohort Projections (Model 2) yields populations (rounded to the nearest hundred) for Atlantic County of 231,600 in 1985, 251,100 in 1990, 264,500 in 1995 and 276,900 in the year 2000.

Projections by Age and Sex

Beginning on page 16, the preferred projections are presented by age and sex. These breakdowns are consistent with those presented for the Economic and Cohort Models (1 and 2). Total projections and total age projections are rounded in hundreds while each age-sex projection is rounded in tens. Thus, the totals for the projections may not add.

The census counts for 1970 and 1980 are not rounded. Since the publication of the 1980 census counts, the total New Jersey and Essex County populations have been revised, respectively, to 7,365,011 and 851,304, as shown in the summary tables. But because the age-sex detail has not been revised for 1980, the totals shown for 1980 in the age and sex detailed tables for New Jersey and Essex County do not agree with the revised totals.

The population for April 1, 1970 has been revised since publication of the 1970 census. Age and sex groups were also revised. However, the age groups 75 to 79, 80 to 84 and 85 years and over were collapsed into one age category - 75 years of age and over.

Range of Preferred Projections: ODEA Economic/Demographic and ODEA Demographic Cohort Models

Users of the preferred projections may wish to view the two models as establishing a range for potential population change in the future. A narrow range is indicative that projected labor market conditions produce a migration pattern similar to the pattern prevailing in the 1970s and that a certain consistency exists between the economically based migration of the Economic/Demographic Model (1) and the demographically based migration of the Demographic Cohort Model (2). On the other hand, a wide range indicates that projected labor market conditions produce a different migration pattern from that of the these counties. The table on the next page shows the county ranges produced by the two preferred ODEA models for the year 2000. In that year, the ranges in projected populations between the two models tend to be widest.

As mentioned previously, it is interesting to note that application of the Hotel-Casino Population Adjustment to Atlantic County in the Cohort Model (2) produces a similar population to the Economic Model (1) in the year 2000. Virtually the entire difference between the two models for Atlantic County is due to the projected growth in population associated with casino employment that is incorporated into the Economic Model (1). As demonstrated in the table, application of the adjustment reduces the range by 31,600 persons to only 500 persons.

Although the two ODEA Models are preferred, it must be stressed that they are preferred because they contain theoretical improvements over the regression models. These models allow for age and sex details to be presented - yielding another advantage. They are not preferred for any predictive qualities that may be attributed to them.

REGRESSION PROJECTIONS

The "LINEAR REGRESSION 1900 TO 1980" and the "POLYNOMIAL REGRESSION 1900 TO 1980" Models are primarily presented for comparison to the preferred projections. They are relatively naive extrapolations of past total population trends and do not attempt to project demographic phenomena by cohort. The main feature of these models is that they use an extensive history of population changes on which to base the projections. They contain no special adjustments for population growth associated with the Atlantic County hotel-casino industry. Users of these two regression projections, as well as the Demographic Cohort projection (Model 2), may wish to apply a special hotel-casino adjustment which is shown and explained on pages 6 and 7.

The Linear Regression demonstrates how the growth trends that have prevailed since the beginning of the century would affect population change if they continued to the year 2000. The results of this regression are used to make a straight line projection of population growth for each county using the 1980 census population as a starting point.

The Polynomial Regression utilizes the exact same data inputs as the Linear Regression. However, this regression assumes a curved historical pattern and the results are used to make a curved projection of population growth for each county starting from the 1980 census. Because this regression utilizes more explanatory variables, the polynomial regression equation explains

COMPARISONS OF THE PREFERRED MODEL PROJECTIONS OF NEW JERSEY POPULATION BY COUNTY FOR THE YEAR 2000

COUNTY	ODEA ECONOMIC/ DEMOGRAPHIC MODEL (1)	ODEA DEMO- GRAPHIC COHORT MODEL (2)	DIFFERENCE IN ODEA MODELS ECONOMIC MINUS COHORT MODEL (1) MINUS MODEL (2)
NEW JERSEY	8,396,600	7,851,500	545,100
ATLANTIC COUNTY	277,400	245,800 *	31,600 *
BERGEN COUNTY	951,400	707,800	243,600
BURLINGTON COUNTY	471,900	487,000	- 15,100
CAMDEN COUNTY	555,900	526,400	29,500
CAPE MAY COUNTY	91,600	138,300	- 46,700
CUMBERLAND COUNTY	142,600	153,700	- 11,100
ESSEX COUNTY	760,700	739,900	20,800
GLOUCESTER COUNTY	269,100	265,700	3,400
HUDSON COUNTY	516,500	506,000	10,500
HUNTERDON COUNTY	112,800	113,200	- 400
MERCER COUNTY	359,400	301,900	57,500
MIDDLESEX COUNTY	757,100	603,300	153,800
MONMOUTH COUNTY	588,200	580,800	7,400
MORRIS COUNTY	511,300	423,900	87,400
OCEAN COUNTY	447,300	605,700	-158,400
PASSAIC COUNTY	445,100	421,200	23,900
SALEM COUNTY	69,100	71,400	- 2,300
SOMERSET COUNTY	284,000	199,600	84,400
SUSSEX COUNTY	172,600	198,200	- 25,600
UNION COUNTY	518,800	454,200	64,600
WARREN COUNTY	93,800	107,400	- 13,600

* If the ODEA Cohort Model (2) Projection for Atlantic County is adjusted for the impact of the hotel-casino industry from 245,800 to 276,900, then the difference between the two ODEA Preferred Model Projections for Atlantic County is reduced from 31,600 to 500.

Note: Projections are rounded in hundreds. Thus, totals may not add.

zes more explanatory variables, the polynomial regression equation explains more of the historical variation in population than the linear regression.

FUTURE PLANS

The Division of Planning and Research plans to revise and modify these projections as more detailed census data become available and as sources of data are updated. Plans also call for the development of projections for additional characteristics of the New Jersey population. This division hopes that users of the projections, interested agencies and individuals will comment on them. Please direct all comments and suggestions to the Office of Demographic and Economic Analysis, Division of Planning and Research, New Jersey Department of Labor, CN388, Trenton, NJ 08625-0388.

NOTES:
1) Projections are rounded in hundreds. Thus, totals for Projections may not add.
2) Before using these projections, please read the text for the assumptions behind this model.
3) The total Essex County population has been revised to 851,304 for 1980 as shown in the summary tables. But because the age-sex detail has not been revised for 1980, the total shown here for that year is 851,116.

NOTES:
1) Projections are rounded in hundreds. Thus, totals for Projections may not add.
2) Before using these projections, please read the text for the assumptions behind this model.
3) The total New Jersey population has been revised to 7,365,011 for 1980 as shown in the summary tables. But because the age-sex detail has not been revised for 1980, the total shown here for that year is 7,364,823.

New Jersey Department of Labor

NOTES:
1) Projections are rounded in hundreds. Thus, totals for Projections may not add.
2) Before using these projections, please read the text for the assumptions behind this model.
3) The total Essex County population has been revised to 851,304 for 1980 as shown in the summary tables. But because the age-sex detail has not been revised for 1980, the total shown here for that year is 851,116.
